(54) Title: SEATING SYSTEM

(57) Abstract: A seating system having a beam (10) which is adapted to be connected to a surface (23) adjacent the position at which seats are to be located, means whereby seats (50) can be connected to the beam, the beam is so formed as to be adapted to receive a formation (69) on the base of a seat whereby the seat can be located at any required position along the beam. The arrangement is such that the connection of the beam to the surface does not interfere with the location of the seats. The invention permits variation in the position of the seats relative to the beam to be readily effected and various modification of the seats and ancillaries are described.
